Google is the most popular search engine ever created, but Google's search capabilities are so powerful, they sometimes discover content that no one ever intended to be publicly available on the Web, including social security numbers, credit card numbers, trade secrets, and federally classified documents. *Google Hacking for Penetration Testers, Third Edition,* shows you how security professionals and system administratord manipulate Google to find this sensitive information and "self-police" their own organizations.

Editorial Reviews

About the Author

Johnny Long is a Christian by grace, a professional hacker by trade, a pirate by blood, a ninja in training, a security researcher and author. He can be found lurking at his website (http://johnny.ihackstuff.com). He is the founder of Hackers For Charity(http://ihackcharities.org), an organization that provides hackers with job experience while leveraging their skills for charities that need those skills.

Bill Gardner is an Assistant Professor at Marshall University, where he teaches information security and foundational technology courses in the Department of Integrated Science and Technology. He is also President and Principal Security Consultant at BlackRock Consulting. In addition, Bill is Vice President and Information Security Chair at the Appalachian Institute of Digital Evidence. AIDE is a non-profit organization that provides research and training for digital evidence professionals including attorneys, judges, law enforcement officers and information security practitioners in the private sector. Prior to joining the faculty at Marshall, Bill co-founded the Hack3rCon convention, and co-founded 304blogs, and he continues to serve as Vice President of 304Geeks. In addition, Bill is a founding member of the Security Awareness Training Framework, which will be a prime target audience for this book.

Justin Brown (@spridel11) is an Information Assurance Analyst at a large financial institution. Previously, Justin worked for as a consultant specializing in Open Source Intelligence. Through Google Hacking and dorks Justin has uncovered numerous troves of information leaks regarding his clients. Justin can usually be found at conferences volunteering with Hackers for Charity.

Most Helpful Customer Reviews

1 of 1 people found the following review helpful

⭐⭐⭐⭐⭐ **Overall, this is an interesting and informative read, highly recommended.**

By Ian Stirk on January 5, 2016

Format: Paperback

Hi,

I have written a detailed chapter-by-chapter review of this book on www DOT i-programmer DOT info, the first and last parts of this review are given here. For my review of all chapters, search i-programmer DOT info for STIRK together with the book's title.

With regular breaching of websites/data in the news (e.g. eBay, Three, VTech), this book should be of interest to many.

This book aims to show you what information can be found via Google search queries, much of it never intended for a public audience (e.g. credit card numbers, passwords). The book is targeted at those wanting to protect their sites/data, those wanting to get more out of Google search queries, hackers, and the curious.

Some of the tools are introduced with little discussion, so some degree of IT-awareness is required. Also a few areas require scripting knowledge (typically using perl).

Below is a chapter-by-chapter exploration of the topics covered.

Chapter 1 Google Search Basics

The chapter opens with a look at Google's deceptively simple interface, being void of clutter and having a single place to enter search criteria. Various related screens are examined, including image search, groups, preferences, language tools, and the results page.

The chapter continues with a look at rules for Google searching, including the use of wildcard characters, and the 32-word search limit. The use of quote marks for exact phrase searching, and Boolean operators for joining/omitting results is discussed with examples. Getting more targeted search results by search reduction is examined.

The chapter ends with a look at the format of the Google URL for submitted queries, where search parameters and their values are separated by an ampersand. Read more ›
